BICA chair structures are mostly made of round steel tube, 1.5 mm thick, recycled and recyclable.

The entire process of structure degreasing is done without the use of water or acids, but with steel grit pickling. Besides having great ecological value, this action allows a greater efficiency in the adherence of the painting, due to its rough finishing.

In the case of outdoor material, the next process is the casting of zinc with the metal itself, by means of projection, also without the use of solvents or acids. In any of these finishes, the final texture allows a high adherence to the painting.

The final finishing is done through a powder painting process, by electrodeposition, followed by baking in an oven at 210 degrees to transmit hardness and resistance. In order to keep the colors alive, we use finishes with UV protection, which makes you enjoy your chair for a longer time.

Our upholstery has the highest quality standards and certifications, both for personal and professional use. The natural woods applied are FSC (Forest Stewardship Council) and finished with natural oils. We use 316 Stainless Steel screws to fix them.

The following dimensions may suffer minor changes.
